Bivariate Regressions of *sacratio* on Model
Attribute Variables, Rule Fixed Effects

Wealth Effect	$R^2 = .08$
Net Worth Effect	$R^2 = .12$
Bank Credit Effect	$R^2 = .06$
Other Channel	$R^2 = .05$
Learning	$R^2 = .05$
Open	$R^2 = .05$
Calvo Pricing	$R^2 = .05$
Rotemberg Pricing	$R^2 = .07$
Sticky Prices Other	$R^2 = .13$
Sticky Wages	$R^2 = .08$
Wage Indexation	$R^2 = .05$
Price Indexation	$R^2 = .09$
	$R^2 = .05$
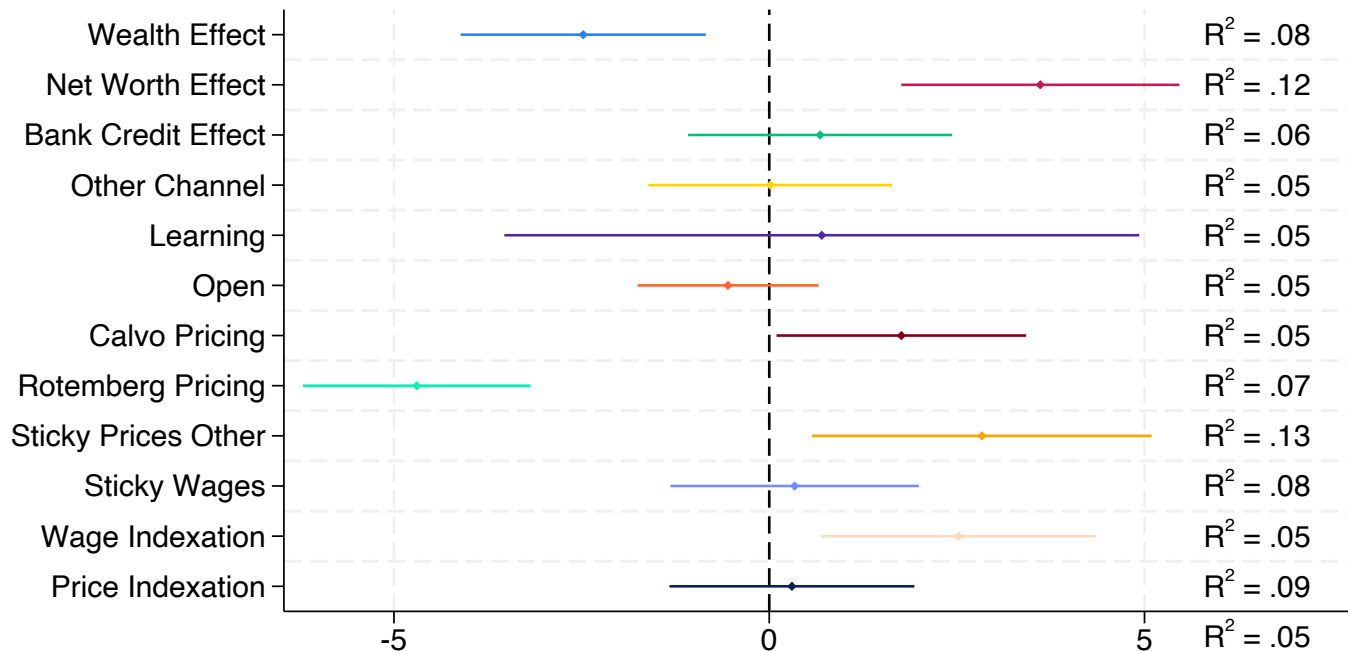

Bands represent 90% confidence intervals.
Regressions are of form: *sacratio = c + a*rule_tr + b*rule_g + beta*(model attribute)*
