Bivariate Regressions of *Billsacrat* on Model Attribute Variables, Rule Fixed Effects

Wealth Effect	$R^2 = .15$
Net Worth Effect	$R^2 = .27$
Bank Credit Effect	$R^2 = .23$
Other Channel	$R^2 = .24$
Learning	$R^2 = .23$
Open	$R^2 = .16$
Sticky Prices	$R^2 = .17$
Calvo Pricing	$R^2 = .26$
Rotemberg Pricing	$R^2 = .16$
Sticky Prices Other	$R^2 = .19$
Sticky Wages	$R^2 = .18$
Wage Indexation	$R^2 = .23$
Price Indexation	$R^2 = .17$
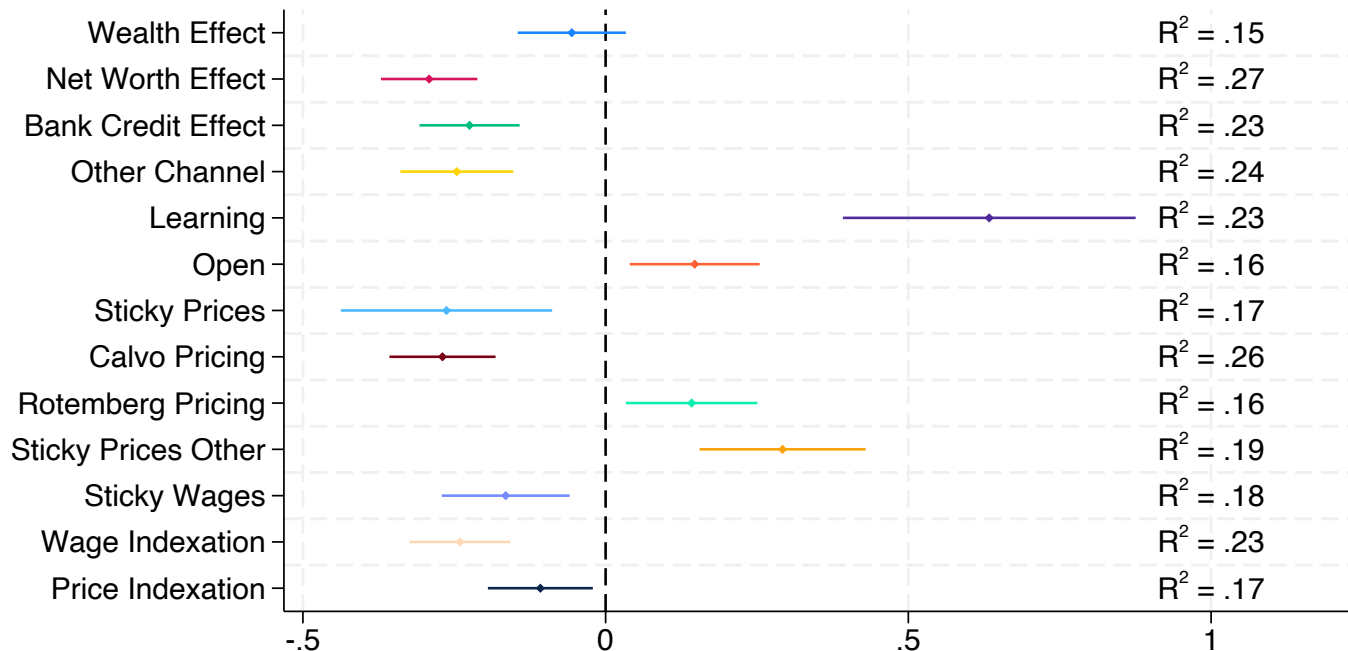

Bands represent 90% confidence intervals.
Regressions are of form: *Billsacrat = c + a*rule_tr + b*rule_g + beta*(model attribute)*
